This article explores the core concepts and components of cell biology, emphasizing the structure and function of cells, the molecular machinery within, and the dynamic processes that sustain cellular life.

Fundamental Concepts of Cell Biology

Cell Theory

The foundation of cell biology is built upon the cell theory, which states:

- All living organisms are composed of one or more cells.
- The cell is the basic unit of structure and function in living organisms.
- All cells arise from pre-existing cells through cell division.

This theory underscores the universality of cells and their central role in biology.

Types of Cells

Cells are broadly classified into two categories:

- **Prokaryotic Cells:** These are simple, unicellular organisms such as bacteria and archaea. They lack a nucleus and membrane-bound organelles. Their genetic material resides in a nucleoid region.
- **Eukaryotic Cells:** Found in plants, animals, fungi, and protists, these cells are larger and more complex. They possess a nucleus that houses their DNA and various membrane-bound organelles that compartmentalize cellular functions.

Cell Structure and Components

Cell Membrane

The cell membrane, also called the plasma membrane, is a phospholipid bilayer embedded with proteins. It functions as a selective barrier, regulating the entry and exit of substances, maintaining homeostasis, and facilitating communication with the environment.

- Composed mainly of phospholipids, cholesterol, and proteins.
- Contains various proteins for transport, signaling, and structural support.

Cytoplasm and Cytoskeleton

The cytoplasm is the gel-like substance filling the cell, containing organelles and biomolecules essential for cellular processes.

- The cytoskeleton provides structural support, shapes the cell, and enables movement and intracellular transport. It comprises three main components:
 - Microfilaments (actin filaments)
