## Designing an Electric Door Lock System with Picaxe 08

### Core Components Required

Creating an electric door lock using a Picaxe 08 involves integrating several electronic components to ensure reliable operation. Key components include:

- Picaxe 08 Microcontroller: Serves as the control unit
- Electromagnetic or Motorized Lock Actuator: Converts electrical signals into physical locking/unlocking movement
- Power Supply: Typically 5V DC source, often derived from mains power with regulation
- Relay Module or Transistor Switch: Acts as a switch to control the lock actuator, capable of handling higher current loads

- LCD or LED Indicators: To display status messages or provide visual feedback
- Push Buttons: For manual control or override
- Security Features: Such as password storage, keypad lockout mechanisms
- Protection Components: Diodes (for flyback protection), resistors, and possibly optocouplers

### System Architecture Overview

The typical architecture involves the Picaxe 08 microcontroller interfacing with the user input device (keypad or RFID reader), controlling the lock actuator via a relay or transistor, and providing feedback with LEDs or displays. The system can be expanded with remote control capabilities via serial or wireless modules, such as Bluetooth or Wi-Fi.

## Working Principles of the Electric Door Lock System

### Operation Workflow

The fundamental operation of the Picaxe-based electric door lock can be summarized as follows:

- User Input: The user enters a code via the keypad or presents an RFID tag.
- Authentication: The Picaxe 08 compares the input against stored credentials.
- Verification: If the credentials match, the system proceeds; if not, it may activate an alarm or lockout.
- Actuation: The microcontroller sends a signal through a relay or transistor to energize the lock

actuator.

- Lock/Unlock: The physical lock mechanism moves, either releasing or securing the door.
- Feedback: Indicators display status, such as "Unlocked" or "Access Denied."
- Timeout/Auto-lock: Optional features can automatically lock the door after a set period.

## Controlling the Lock Actuator

Since the Picaxe 08 cannot supply enough current directly to the lock mechanism, a relay or transistor switch is used. The microcontroller outputs a low-voltage signal, which energizes the relay coil, closing the circuit and powering the lock actuator. Flyback diodes are essential to protect the transistor or relay coil from voltage spikes during switching.

## Programming the Picaxe 08 for Door Lock Control

### Programming Environment

Programming a Picaxe 08 is straightforward thanks to the free and user-friendly Picaxe Programming Editor. The code is written in a BASIC-like language, which is accessible even for beginners.
