Sample Questions and Model Answers from "Pure Dead Brilliant" Series

Biology Sample

Question: Explain the process of photosynthesis.

Answer: Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose. It occurs mainly in the chloroplasts of plant cells, which contain the pigment chlorophyll. The overall equation is: $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{light energy} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$. During photosynthesis, plants take in carbon dioxide and water, and using sunlight, they produce glucose and release oxygen as a byproduct.

Chemistry Sample

Question: What is an acid and how is it different from a base?

Answer: An acid is a substance that produces hydrogen ions (H^+) in solution, and it has a pH less than 7. Acids taste sour, turn blue litmus paper red, and can react with metals to produce hydrogen gas. Bases are substances that produce hydroxide ions (OH^-) in solution, have a pH greater than 7, taste bitter, and feel slippery. Common examples include hydrochloric acid and sodium hydroxide. They react with acids in neutralization reactions to form salt and water.

Physics Sample

Question: Describe Newton's first law of motion.

Answer: Newton's first law states that an object will remain at rest or move at a constant velocity in a straight line unless acted upon by an external force. This law is also known as the law of inertia. For example, a stationary ball will stay still unless a force, like a kick, causes it to move. Similarly, a moving car will continue to move at the same speed and in the same direction unless brakes or other forces change its motion.
