**Question** What is the primary purpose of flowcharts in programming logic and design? **Answer** Flowcharts are used to visually represent the flow of a program, helping developers understand, analyze, and communicate the logic and sequence of operations within the program. Explain the difference between top-down and bottom-up design approaches. Top-down design starts with the overall system and breaks it into smaller components, focusing on high-level structure first. Bottom-up design begins with detailed components or modules and integrates them into a complete system. What is a recursive function, and when is it typically used? A recursive function is one that calls itself to solve a problem by breaking it into simpler sub-problems. It is typically used in tasks like tree traversal, factorial calculation, and divide-and-conquer algorithms. Describe the significance of pseudocode in programming logic and design. Pseudocode provides an informal, human-readable way to plan and outline algorithms before coding, helping programmers focus on logic without syntax constraints. What are the common control structures used in programming logic? Common control structures include sequence, selection (if-else), iteration (loops like for and while), and case/switch statements, which control the flow of execution based on conditions. How does modular design improve the development process? Modular design divides a program into independent, interchangeable modules, making code easier to maintain, test, debug, and reuse, thus enhancing overall development efficiency. What is the role of algorithms in programming logic and design? Algorithms define the step-by-step process to solve a problem efficiently, serving as the foundation for program logic and ensuring correct and optimized solutions. Why is testing important in programming logic and design? Testing verifies that the program functions correctly, identifies bugs or logical errors, and ensures that the design meets the specified requirements before deployment. What is meant by 'coupling' and 'cohesion' in software design? Cohesion refers to how closely related the functions within a module are, promoting single responsibility; coupling describes the degree of interdependence between modules. High cohesion and low coupling are desirable for maintainable and robust systems.
