Implementing Fingerprint Recognition in MATLAB

1. Image Acquisition and Preprocessing

The first step involves obtaining fingerprint images, either through a scanner or dataset. Preprocessing enhances the image quality for feature extraction.

Key steps:

- Noise removal using filters (e.g., median filter)
- Image enhancement via Gabor filters or histogram equalization
- Binarization to differentiate ridges from valleys
- Thinning to reduce ridge lines to single pixel width

```matlab

% Example: Reading and preprocessing fingerprint image

```
fingerprint = imread('fingerprint.png');
```

```
grayImage = rgb2gray(fingerprint);
```

```
filteredImage = medfilt2(grayImage, [3 3]);
```

```
enhancedImage = imsharpen(filteredImage);
```

```
binaryImage = imbinarize(enhancedImage, 'adaptive', 'Sensitivity', 0.4);
```

```
thinnedImage = bwmorph(binaryImage, 'thin', Inf);

imshow(thinnedImage);

title('Preprocessed Fingerprint');

...
```

## 2. Feature Extraction: Minutiae Detection

Detecting ridge endings and bifurcations involves analyzing the thinned fingerprint image.

Approach:

- Use crossing number (CN) method
- Identify pixels with CN values of 1 (ridge ending) or 3 (bifurcation)

```
```matlab  
  
% Minutiae detection example  
  
% Assumes thinnedImage is binary and skeletonized  
  
minutiaePoints = [];  
  
[rows, cols] = size(thinnedImage);  
  
for i = 2:rows-1  
  
    for j = 2:cols-1  
  
        if thinnedImage(i,j) == 1  
  
            neighborhood = thinnedImage(i-1:i+1, j-1:j+1);  
  
            crossingNumber = sum(sum(neighborhood)) - 1;  
  
            if crossingNumber == 1  
  
                minutiaePoints(end+1,:) = [i j]; % Ridge ending
```

```
elseif crossingNumber == 3

minutiaePoints(end+1,:) = [i j]; % Bifurcation

end

end

end

end

plot(minutiaePoints(:,2), minutiaePoints(:,1), 'ro');

title('Detected Minutiae Points');

...

```

3. Template Creation and Matching

Create a feature vector or template from the minutiae points and compare with stored templates for recognition.

- Store minutiae locations, orientations, and types
- Use distance metrics (e.g., Euclidean) for matching

```
```matlab

% Example: simple Euclidean distance matching

% Assume storedTemplate and queryTemplate are structures with minutiae points

distance = norm(storedTemplate.Minutiae - queryTemplate.Minutiae);

if distance
disp('Fingerprint matched.');
```

else

```
disp('No match found.');
```

end

```

Implementing Iris Recognition in MATLAB

1. Image Acquisition and Iris Segmentation

The initial step involves capturing the eye image and segmenting the iris from the sclera, eyelids, and eyelashes.

Segmentation techniques include:

- Edge detection (Canny, circular Hough transform)
- Intensity thresholding
- Morphological operations

```matlab

% Example: Iris segmentation using Hough Transform

eyeImage = imread('eye.jpg');

grayEye = rgb2gray(eyeImage);

edges = edge(grayEye, 'Canny');

% Detect circles for iris boundary

[centers, radii] = imfindcircles(edges, [20 80], 'Sensitivity', 0.95);

imshow(eyeImage);

viscircles(centers, radii);

title('Iris Segmentation');

```

2. Normalization of the Iris

Normalize the iris region into a fixed coordinate system (e.g., polar coordinates) to account for size variations.

```
```matlab
```

```
% Example: Daugman's rubber sheet model
```

```
% Convert iris region to normalized rectangular block
```

```
% (Implementation involves mapping from polar to Cartesian coordinates)
```

```
```
```

3. Feature Extraction using Gabor Filters

Apply Gabor filters to extract texture features that characterize the iris pattern.

```
```matlab
```

```
% Gabor filter bank creation
```

```
wavelength = 4;
```

```
orientation = 0:45:135;
```

```
gaborArray = gabor(wavelength, orientation);
```

```
gaborMag = imgaborfilt(normalizedIris, gaborArray);
```

```
% Binarize the filter responses to generate iris code
```

```
irisCode = imbinarize(mat2gray(gaborMag));
```

```
imshow(irisCode);
```

```
title('Iris Feature Code');
```

```
```
```

4. Matching Iris Templates

Compare the generated iris code with stored templates using Hamming distance.

```
```matlab

% Example: Hamming distance calculation

distance = sum(xor(storedIrisCode, currentIrisCode), 'all') / numel(storedIrisCode);

if distance
 disp('Iris recognized.');
```

else

```
 disp('No match.');
```

end

```

This comprehensive guide offers a foundational understanding of fingerprint and iris recognition using MATLAB, suitable for researchers, developers, and students interested in biometric security solutions.

Fingerprint and iris recognition using MATLAB code have become pivotal in the realm of biometric security, offering robust, reliable, and non-intrusive methods for identity verification. As digital security threats escalate, the demand for sophisticated biometric systems has grown exponentially, leading researchers and developers to harness MATLAB—a high-level language and environment for numerical computation, visualization, and programming—to develop, simulate, and analyze these biometric techniques. This article delves into the foundational concepts of fingerprint and iris recognition systems, explores their implementation using MATLAB, and discusses the key challenges and future prospects in this field.

Introduction to Biometric Recognition Systems

Biometric recognition systems authenticate individuals based on unique biological traits. Unlike traditional methods such as passwords or ID cards, biometrics provide an intrinsic and hard-to-forge means of identification, enhancing security and user convenience.

Key biometric modalities include:

- Fingerprint
- Iris
- Face
- Voice
- Palm print
- Retina

Among these, fingerprint and iris recognition are two of the most mature and widely adopted due to their high accuracy, ease of acquisition, and stability over time.

Understanding Fingerprint Recognition

Fundamentals of Fingerprint Recognition

Fingerprint recognition relies on the unique patterns formed by ridges and valleys on the finger's surface. These patterns are generally consistent over a person's lifetime and include features such as minutiae points, ridge endings, bifurcations, and ridge dots.

Core steps in fingerprint recognition include:

- Image acquisition
- Preprocessing
- Feature extraction
- Matching

Image Acquisition and Preprocessing

The process begins with capturing a high-quality fingerprint image using sensors. In a MATLAB simulation, images are often sourced from existing datasets or captured using image acquisition hardware interfaced with MATLAB.

Preprocessing aims to enhance image quality for reliable feature extraction:

- Histogram equalization: Improves contrast
- Noise reduction: Using filters like median or Gaussian filters
- Binarization: Converts image to binary (black and white)
- Thinning: Reduces ridges to single-pixel width for easier analysis

Feature Extraction Techniques

One of the most critical phases involves extracting minutiae points:

- Minutiae detection algorithms identify ridge endings and bifurcations.
- Template creation: Store the minutiae coordinates and types for matching.

Common algorithms include crossing number methods, ridge flow analysis, and orientation field estimation.

Matching Algorithms

Matching involves comparing the extracted features against stored templates:

- Matching score calculation based on minutiae correspondence.
- Decision threshold: If the score exceeds a set threshold, the fingerprint is accepted.

Algorithms such as the nearest neighbor, alignment-based matching, and graph matching are implemented in MATLAB to achieve this.

Iris Recognition: An Overview

Principles of Iris Recognition

The iris exhibits complex, unique patterns that remain stable over an individual's lifetime. Iris recognition involves capturing a high-quality image of the eye, isolating the iris, and extracting distinctive features.

Main steps include:

- Image acquisition
- Iris localization
- Normalization
- Feature encoding
- Matching

Image Acquisition and Iris Segmentation

In MATLAB, high-resolution eye images are utilized. Segmentation isolates the iris by detecting the inner (pupil) and outer (limbus) boundaries.

Techniques include:

- Circular Hough Transform
- Edge detection (Canny, Sobel)
- Circular fitting algorithms

Accurate segmentation is vital to remove noise and eyelids/eyelashes.

Normalization and Feature Extraction

Post segmentation, the iris is unwrapped into a normalized rectangular block (rubber sheet model). This process compensates for size variations and pupil dilation.

Feature encoding often employs:

- Gabor filters
- Wavelet transforms
- Log-Gabor filters

These extract texture features, resulting in a binary iris code, which is a compact representation suitable for fast matching.

Matching and Decision Making

Comparison involves calculating the Hamming distance between iris codes:

- Hamming distance: Measures the bit-wise difference.
- A threshold determines acceptance or rejection.

MATLAB functions facilitate bitwise operations and distance calculations for efficient matching.
